It can load its data from an excel file, sql file or an access file.

It consists of female and male amoeba's, including enemy's that eat the amoebe.

Every run the current state of the picturebox is saved to an access file.

There is a large list of reactions that each amoeba has on another amoeba. But i'm not going to get into that much detail.

If anyone cares here is the complete [source](#) file.

And here is a small sample [movie](#) of how the program works.
